

Drip - Privacy-First AI Companion

A relationship-wellness AI that privately listens to each partner, keeps a memory that strictly governs what can be shared, and lets a human operator review and approve the AI's output. Built and owned end to end by Dev Ganugapenta, Founder, InitDev.

INTEGRATIONS

Strongest technical accomplishments

- **Privacy-aware dual-store memory** (Pinecone + Postgres) with classifier guardrails and vector-rollback so one partner's private content never leaks. IMPL
- **Human-in-the-loop console**: draft to approve to send state machine, manual takeover, audit trail. IMPL
- **Resilient LLM turn**: OpenAI structured outputs, 3x retry + backoff, 3s non-blocking retrieval timeout. IMPL
- **Stateful journey engine** (sessions 0a-4b) driving prompts, nudges, and lifecycle email. IMPL
- **Billing lifecycle** with signature-verified Stripe webhooks. IMPL NO DEDUP

Verified proof points

57 of 98 API routes are operator/admin - a real control plane, not a chat toy.

Send-gate: AI drafts cannot be sent until a human approves (`requires_approval`).

Developer ownership

- Sole author of all 528 commits (2025-07 to 2026-02); frontend, backend, data, AI, billing, deploy.
- Set the privacy-first architecture that defines the product.
- Post-launch hardening: CVE patch, privacy + race-condition fixes.

Architecture & stack

Next.js 15 / React 19 / TypeScript. Clerk auth, Supabase Postgres, Pinecone vectors, OpenAI `gpt-4.1`, Stripe, Resend, PostHog. Deployed on Vercel (standalone, scheduled cron).

Default-private memory classification with off-limits guardrails (infidelity/abuse/self-harm).

Honest gaps: 0 automated tests, some admin-API auth + durable queue still to harden.
